Projects

[TransportService](#) | *Node JS Express JS JavaScript Mongoose* | January, 2026
I developed the backend part of the TransportService project using JavaScript. The project was built with Express.js and uses MongoDB with Mongoose as the database. It helps manage the entire job system and includes permissions, authentication, access and refresh tokens, validations, custom logging, and error handling.

[YouTube](#) | *Node JS Express JS JavaScript PostgreSQL* | December, 2025
I developed my own YouTube-like backend project using JavaScript and Express.js. The project includes OTP-based authentication, input validations, and core features required for a video platform. It was built as a personal learning project to understand how YouTube-style systems work at a basic level.

[UserBot](#) | *Node JS JavaScript Telegram API Telegraf.js* | February, 2026
I developed a Telegram UserBot using JavaScript. The bot automatically reads incoming messages and replies based on predefined logic. It includes message filtering, duplicate message detection, user stop/ignore logic, and basic logging. The project was built to improve automation and real-time message handling skills.

Technical skills:

Node JS, Express JS, Nest JS, JavaScript, TypeScript, Python , C, PostgreSQL, MySQL, MongoDB, Mongoose

Soft skills:

Communication, Leadership, Adaptability, Problem solving.

Education

Uzbekistan State National University | Information technologies
